MB-D(LE) 415 - 420 B01

7.23

Technical description

The DUNGS GasMultiBloc® integrates filter, regulator, valves and pressure switches in one compact fitting.

- Dirt trap: microfilter
- One regulator and two valves: B01
- Two valves are fast opening
- One valve is fast opening and one valve is slow opening
- Solenoid valves up to 360 mbar (36 kPa) as per DIN EN 161 Class A Group 2
- Sensitive setting of output pressure by proportional regulator as per DIN EN 88 Class A Group 2
- High flow rates with low pressure drop
- DC solenoid drive interference degree N
- Main volume restrictor at valve V2
- Hydraulic opening delay
- Flange connections with pipe threads as per ISO 7/1
- Simple mounting, compact, light-weight

The modular system permits individual solutions by using external ignition gas tap in connection with separately controlled valves, by adding a valve proving system, mini/maxi pressure switches, pressure limiters, limit switch at valve V2.

Application

The modular system permits individual solutions in gas safety and regulator engineering. Suitable for gases of families 1, 2, 3 and other neutral gaseous media.

Approvals

EU type testing certificate as per:

- EU-Gas Appliances Regulation
- EU-Pressure Equipment Directive
- Approvals in other important gas consuming countries.

Functional description of gas flow

- 1. When the valves V1 and V2 are closed, chamber A is under inlet pressure.
- A hole D in the filter housing connects min. pressure switch with chamber A. If the inlet pressure applied to the pressure switch exceeds the incoming reference value, it switches through to the automatic burner control.
- 3. After release by the automatic burner control, valves V1 and V2 open. The gas flows through chambers A, B and C of the GasMultiBloc.

Operating method of valve-regulator combination on valve V1

A regulator, compensating for residual pressure is integrated in valve V1 (pressure regulating part). Armature 7 is not connected with valve plate unit 3. When it opens, armature 8 pretensions compression spring (V1) 5 and releases the valve plate unit.

When the valve closes, the armature acts directly on the valve plate unit.

The output pressure upstream of valve V2 is defined by pretensioning regulating spring 8 (tension spring) via setting screw 17.

The output pressure acts via opening E on the working diaphragm 21 of the regulator part. In regulated state, setting spring inlet pressure and pressure of working diaphragm are in force equilibrium.

The compensating diaphragm 22 ensures the fast closing function of valve V1 and a high regulating quality.

Operating method of valve V2

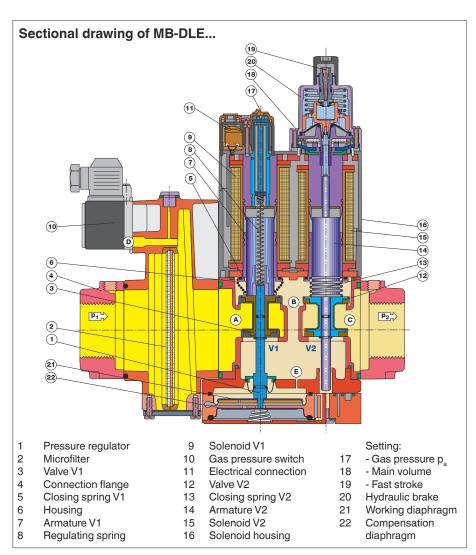

The armature 14 of valve V2 is connected to valve plate unit 12. When it opens, armature 14 pretensions the closing spring 13. The max. valve opening can be set by limiting the armature stroke by means of the main volume restrictor 18.

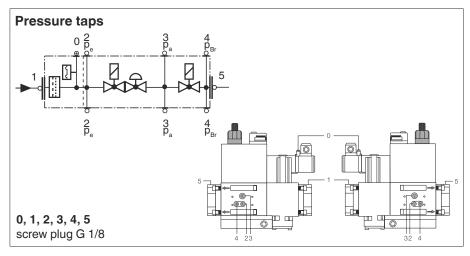

Min. opening (residual stroke) of valve (0.5 to 1.0 mm)

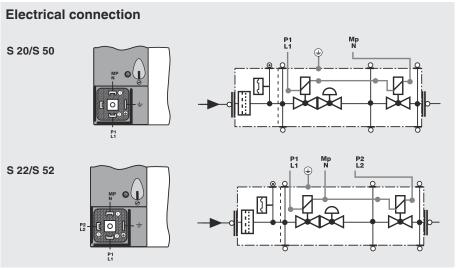

The main volume restrictor 18 is set by rotating the adjusting plate or the hydraulic brake 20. The fast and/or slow opening characteristic is influenced by setting fast stroke 19 at the hydraulic brake under the cover.

Closing function

When the supply voltage to the solenoid coils of valves V1 and V2 is interrupted, they are closed within < 1 s by the compression springs.

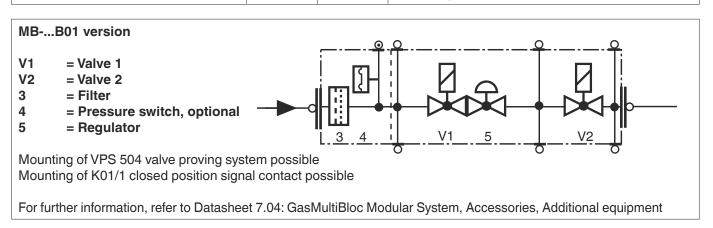

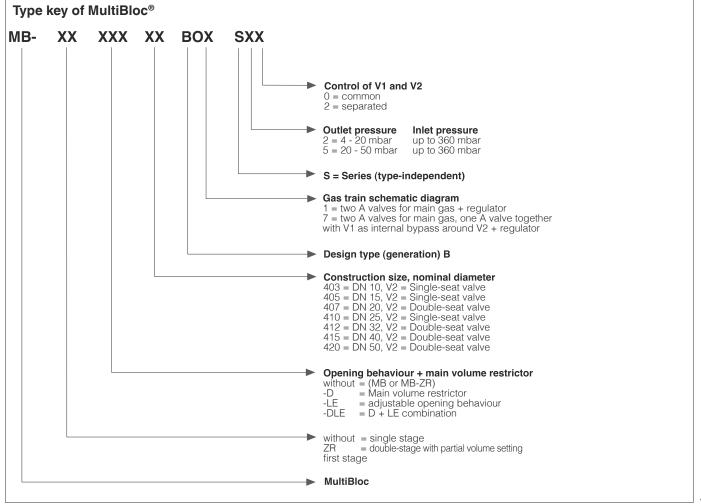

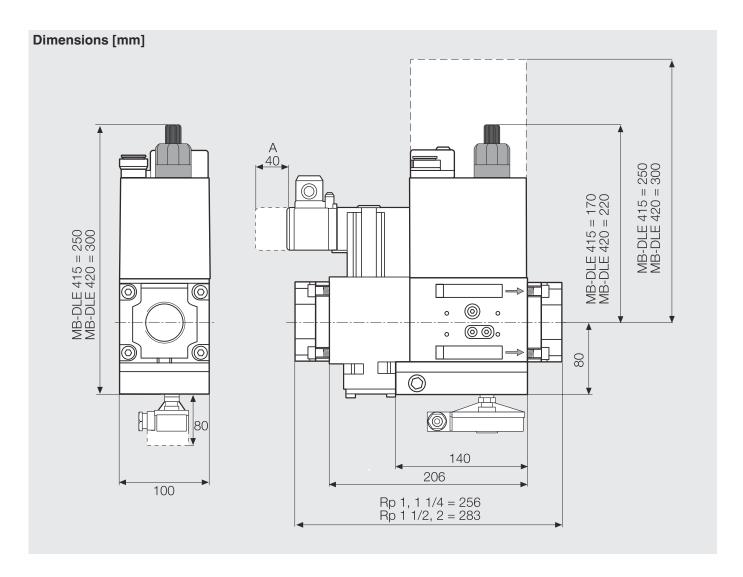

Specifications

Dirt trap Sieve, microfilter, changing the filter is possible without removing the valve. Pressure switches Types GWA5, ÜBA2 / NBA2 to DIN EN 1854 may be attached. For further information, refer to Datasheets 5.02 and 5.07 "Pressure Switched for DUNGS Multiple Actuators" Pressure regulator Pressure regulator compensated for residual pressure, leakproof seal where switched off by means of valve V1 as per DIN EN 88 Class A. Setpoint spring permanently installed (no spring exchange possible). A vent line above roof is not required. Internal pulse tap provided.
