

## Oil Burner Nozzles and Accessories

for residential applications

TO PROVIDE HIGH-TEC COMBUSTION
THAT IS ENVIRONMENTALLY FRIENDLY

Delavan has specialized in the development and production of components for highly specialized industries for over 50 years. The Bamberg, South Carolina, plant produces a wide range of oil burner nozzles for domestic and industrial applications as well as accessories for the heating business in general.

Delavan's inspectors have the latest test instruments such as this video projection microscope, here being used to inspect the orifice dimension on the face of the nozzle.

Delavan 100% tests its nozzles for flow rate and spray angle using test oil, maintained to nominal fuel oil properties. Each is rotated to check symmetry and spray quality, and to look for any voids, streaks, or pulsations in the spray pattern.

Delavan inspectors audit nozzle components numerous times during production prior to assembling and testing. These checks are done to ensure the highest quality product is delivered.

Delavan has been designing and manufacturing nozzles for oil heating industry for over 60 years. Quality assurance was important to us way back then and still is today. Since those early days, Delavan has grown and expanded into other product lines as well, such as gas turbine engine nozzles and accessories; nozzles, pumps and accessories for agricultural and industrial spraying.

Delavan is unique in the oil heating industry because we have developed training materials and programs to educate the oil heating service technician. Our nozzles are the most widely distributed in the U.S. and Canada and are also exported to many other countries. Delavan is the leader in designing and manufacturing nozzles for special industrial combustion applications. We specialize

in assisting original equipment manufacturers in designing and specifying the best nozzles to fit their applications.

Whether you are an engineer designing original oil burner equipment or a service technician performing annual service, remember Delavan for assured quality and call on our knowledge and experience whenever you have a combination nozzle application problem.

### Why is Delavan so different?

### **→**UNIQUE INSIDE ANTI PLUG CONSTRUCTION

### 100% Tested

Every nozzle tested.
Then we go one step further and clean the test oil from the nozzle to avoid plugging.

### MEET THE CHALLENGE

- World leader in spray technology
- ISO 9001 Certified
- State of the art manufacturing equipment
- High technology research, design and quality assurance methods

### THE WORLD DIMENSION

- Two manufacturing facilities with R and D in the USA.
- Manufacturing and marketing facility in the UK.
- Marketing and technical services in Belgium.
- Intercontinental distribution network

### **SMART VALVE DESIGN REDUCES COMBUSTION POLLUTION FOR CLEANER HEATING**

The all-new Delavan ProTek™ Nozzle System provides the first step into the future of Clean Air Technology™. This unique, patented System from Delavan provides significant reductions in combustion pollutants for cleaner air. The ProTek Nozzle System includes a factory-installed, one-piece Valve Component which reduces smoke and oil smell in the off cycle by preventing oil afterdrip from the nozzle. Also, the reduction of smoke (carbon and soot) helps maintain burner set up efficiency longer and extend the time period between appliance clean ups.

Installation is fast and easy; there's no need to increase pump supply pressure at installation because there's no pressure drop. Plus, ProTek Nozzle Systems maintain the same flow pattern and flow rating characteristics of comparably rated Delavan nozzles.

The dramatic benefits of the ProTek Nozzle System are available in either a factory-installed, complete system or as the ProTek Valve Component sold separately to replace the standard filter on a Delavan nozzle.

reduced when the Delavan ProTek™ Nozzle System is used. Hydrocarbons are typically elevated at start-up and shut-down of the nozzle firing, as both of these graphs show. When the ProTek Nozzle System is installed, the dramatic benefits are seen in these charts which show comparative results with and

without the ProTek<sup>™</sup> valve. Results will vary by application.

### **EK TALK**

The Delavan ProTek<sup>™</sup> Nozzle System has been thoroughly tested. In the tests, approximately seven years of "on/off" cycle operation simulation in the laboratory with no failures. A total of 107,000 cycles were recorded. After the first 11,350 cycles, the cut-on pressures shifted upward an average of 3.0 PSI. The cut off pressure shifted up an average of 7.75 PSI. After this initial seating process, there was very little change of either "on" or "off" pressures. Very little change in nozzle flow was noted after 107,000 cycles, either. Additional testing has included pressure tests up to 500 PSI (34,5 BAR), as well as combustion tests and tests with various fuels such as kerosene, #2, and heavier oils. Detailed test results are available from Delavan Technical Services.

### **Operating Pressures**

|                 | Minimum Operating Pressures |             |             |  |
|-----------------|-----------------------------|-------------|-------------|--|
| Valve<br>Part # | Supply Pump                 | Valve Open  | Valve Close |  |
| Part #          | PSI (BAR)                   | PSI (BAR)   | PSI (BAR)   |  |
| 60030-1         | 135.0 (9,3)                 | 125.0 (8,6) | 65.0 (4,5)  |  |
| 60030-2         | 100.0 (7,0)                 | 60.0 (4,1)  | 45.0 (3,1)  |  |
|                 |                             |             |             |  |

### A VARIETY OF NOZZLES THAT SUITS EVERY APPLICATION

HOLLOW-CONE Type A-nozzles are mainly used on burners with a hollow cone air pattern and for through puts up to 2.00 GPH. The droplet distribution is concentrated on the outside of the cone and results in good ignition and low-noise combustion.

SOLID-CONE Type B-nozzles produce a spray that distributes droplets fairly uniformly throughout the complete pattern. The spray pattern becomes progressively more hollow at higher flow rates, particulary above 8.00 GPH. Provides smooth ignition and efficient combustion, particulary in larger burners.

Type W "ALL PURPOSE "-nozzles are neither truly hollow nor solid. These nozzles frequently can be used in place of either solid or hollow cone nozzles between 0.40 and 8.00 GPH, regardless of the burner's air pattern. The lower flow rates tend to be more solid.

Type AR-D Nozzles are of a "solid cone" type similar to Type B but with a slightly lower concentration of the droplets in the center of the cone. They are high performance in burners of low up to medium capacity (up to flows of 2.00 GPH).

Type R-D Nozzles have a high concentration of droplets in the center of the spray cone. They are particularly recommened for burners with a highly concentrated solid air pattern. The average droplet size is slightly coarser than on the Standard Solid Cone Type B.

Type .579 MH Mobile Home Nozzles are low-capacity nozzles designed for mobile home use. This design will minimize the usual plugging problems associated with low flow rates.

Semi-Solid nozzle (.50-2.00) 60°, 70° and 80° spray angles; interchanges with other SS nozzles.

Del-O-Flo<sup>™</sup> nozzles are low-capacity nozzles designed to minimize the plugging problems associated with very low flow rates. The special interior design of the Del-O-Flo<sup>™</sup> flushes contaminants through, limiting build-up. These nozzles will satisfactorily interchange with other hollow and solid cone nozzles. The Del-O-Flo<sup>™</sup> is available in 0.40 GPH up to 0.85 GPH.

### Oil Burner Nozzles For Residential Applications AVAILABLE NOZZLE SIZES

|              | Types A and B |     |     |  |     |     |
|--------------|---------------|-----|-----|--|-----|-----|
| GPH          | 30°           | 450 | 60° | 70°  | 80° | 900 |
| .40          |               |     |     |  |     |     |

#### NOZZLE INTERCHANGE

Replacing a nozzle of one make with another sometimes presents problems. This is partly due to unique design differences among the various makes, plus the fact that the nozzle manufacturers use different methods for evaluating spray angles, patterns and spray quality.

In many cases, nozzles with similar patterns and spray angles are directly interchangeable. However, there are other cases where nozzles that would seem to be equivalent really are not. When this happens it is best to ask the burner manufacturer for a recommendation. Otherwise, it is a matter of trial and error: (1) Trying nozzles with slightly higher or lower flow rates, (2) wider or narrower angles and (3) more solid or more hollow patterns, to see which one performs best.

| Nozzle Interchange Chart |                 |  |  |  |  |
|--------------------------|-----------------|--|--|--|--|
| Spray Angles 3           | 80° through 90° |  |  |  |  |

\*The original B Nozzle

**WARNING:** Improper modification to combustion units may create a fire hazard resulting in possible injury. Contact the original equipment manufacturer before modifying the combustion unit.

P.O. Box 969 • Bamberg, SC 29003 www.delavaninc.com

#### **NOZZLE RATINGS AND TESTING**

Every nozzle is spray tested for flow rate, spray angle and spray quality. Our nozzles are flow rated at 100 psi. Test conditions include: fuel gravity within a total spread of 1-1/2° API . . . viscosity within  $\pm$  .04 centistoke (.03 SSU) . . . pressure at 100 psi . . . fuel temperature at 80°F,  $\pm$  2°F . . . an air-conditioned test area maintained at a temperature spread of 4°F or less . . . and regularly calibrated pressure gauges and flow meters.

#### **BURNER/NOZZLE SELECTION**

Proper nozzle selection is a subject of great importance because the performance of the nozzle is so directly related to the overall performance of the burner. The wrong choice of flow rate, spray angle or spray pattern for a given burner air pattern can result in improper firing.

To match a nozzle to a burner takes field-service experience, or trial-and-error, or a good foundation of understanding angles, rates and patterns. Refer to Delavan's service technicians guide #884, "A Total Look at Oil Burner Nozzles" for more technical information on nozzle selection and understanding angle, rates and patterns. Also refer to the Burner Manufacturers' Recommendations Chart below.

| Manufacturer | Model             | Delavan Nozzle                      |                            |  |

\*Effective November 1999. Subject to updating by burner manufacturers. For models not listed contact burner manufacturer. Always follow the appliance manufacturer's instructions for the correct nozzle specification.

**WARNING:** Improper modification to combustion units may create a fire hazard resulting in possible injury. Contact the original equipment manufacturer before modifying the combustion unit.

NOTE: Information on this chart is to be used as a general guide only.

• 1/8" NPT inlet and outlet threads

Easy installation (see drawing)

NOTE: Replace the line filter during the annual service check for an economical way to maintain clear lines.

### Line Filter

Use Delavan's line filter for extra filtration in burner applications of 2.00 GPH or less. These offer four times the filtering area of a standard nozzle stainer and twice the protection. A plugged line filter can cause a pressure drop. Check the pressure on the outlet side of the filter while the unit is flowing to see that it is the same as the pump pressure. If less, replace filter.

### SINTERED FILTERS & STRAINERS

Nozzles up to 2.00 GPH have as standard a sintered filter. From 2.25 up to 15.00, monel filters are provided. Nozzles with through-put of 16.00 GPH and higher have no filter attached.

| Type            | Part #  | Media/Mesh size |
|-----------------|---------|-----------------|
| Sintered Filter | 45560-4 | 25 Micron       |
| Sintered Filter | 45560-1 | 40 Micron       |
| Mesh Strainer   | 46046-1 | 74 micron/200M  |
| Mesh Strainer   | 46046-2 | 125 Micron/120M |
|                 |         |                 |

It is recommended to use sintered filters on nozzles with low throughput.

### NOZZLE ADAPTERS

All nozzle adapters are made of brass, with precision machined mating surfaces for proper sealing.

IMPORTANT specify 1/8" or 1/4" pipe thread size

All nozzle adapters 9/16-24 UNEF internal thread

|          | Thd Size | Part Number |
|----------|----------|-------------|
| Long     | 1/8"     | 28738-1     |
| (Female) | 1/4"     | 28738-3     |
| Standard | 1/8"     | 28737-1     |
| (Female) | 1/4"     | 28737-3     |
| Male     | 3/8"     | 28741-1     |

### DISPLAY STORAGE RACKS

An attractive black plastic display and storage rack is available and will hold up 120 nozzles (12 vials in 10 slots). It is inexpensive, lightweight and easy to mount on the wall. Holes are drilled in the rack for easy mounting. This rack is packaged two to a carton; order in multiples of

Also available is a metal nozzle rack that will hold more than 500 nozzles. It can be mounted flush or at an angle on a wall. Mounting brackets are furnished.

Part number #47749 #32779

### nozzle changer: two in one

Delavan's versatile nozzle changer passes through the small openings of the flame retention-disc. Just snap off outer socket and use the inner socket alone to remove the nozzle.

For wider openings, snap on outer socket and use like a standard nozzle changer. The nozzle changer fits the hex of the adapter (3/4''), and the nozzle hex (9/16").

Part number: #34478

### TELESCOPING MIRRORS

Three types of flame inspection mirrors are available... the round (3-3/4" dia.), the rectangular (1-15/16x3-3/4") or mini (1-1/8x3"). They are furnished with handles, which telescope down to fit into a service technician's kit. A cloth bag is provided to protect the mirror finish.

#### Mirror Parts:

#12269 Rectangular Mirror Head Assembly #33175 Mini Mirror w/handle #12672 Round Mirror Head Assembly #33174 Mini Mirror Head Assembly #13148 Swivel Bracket Assembly

Complete Mirror Assemblies: #12640 Round mirror w/handle #12275 Rectangular mirror w/handle

### **ADAPTRAP**

A nozzle adapter designed to reduce the volume of oil in the adapter and minimize oil after drip. Specify 1/8" or 1/4" NPT pipe thread size and length.

Available in brass only.

|          | Part Number   |               |  |  |  |
|----------|---------------|---------------|--|--|--|
| Thd Size | 1 5/8" Length | 1 3/8" Length |  |  |  |
| 1/8"     | 37231-3       | 37231-1       |  |  |  |
| 1/4"     | 37231-4       | 37231-2       |  |  |  |

### SERVICE TECHNICIANS KIT

This kit is designed to hold 41 nozzles and is constructed of heavy-gauge steel with carrying handle, snap latch and removable steel tray. It is also designed to hold the following accessories:

#32781-4 1/4" test gauge (0 to 300 psi)

#29168 Plastic containers for filters and strainers

#34478 Nozzle changer

# 2838 Female coupling (1/4" FPTx1/4" flare)

# 2839 Half union (1/8"x1/4" flare) #26846-3 Kit with tray only

# 2840 Half union (1/4"x1/4" flare) #2624 Kit with accessories

### PRESSURE & VACUUM GAUGES

Accessories available include pressure and vacuum gauges, nozzle boxes, a display and storage rack and telescoping mirrors.

#32781-4 -- 1/4" Pressure Gauge

#32781-2 -- 1/4" NPT Vacuum Gauge

### nozzle boxes

Delavan nozzle boxes handle all brands of nozzle vials. Our 110-nozzle and 55-nozzle boxes are made up of heavy-gauge steel with rugged hinges and snap-latch construction... finished in baked-on jet black enamel.

#26846-4 -- 110 Nozzle Box -- (5" x 3 5/8" x 11 15/16")

Visit our website at www.delavaninc.com for more details about our products and services.

#26846-5 -- 55 Nozzle Box -- (5" x 1 3/4" x 11 15/16")

## Type WDA & WDB Pressure Atomizing Nozzles for humidifying

### **Spray Characteristics**

- Finely atomized cone spray pattern for humidifying
- WDA has a hollow cone pattern
- WDB has a solid cone pattern
- Available spray angles 30, 45, 60, 70, 80 and 90

### **Ordering Instructions**

WHEN ORDERING TYPE WDA & WDB NOZZLES, be sure to specify the following:

- 1) Nozzle number per capacity chart
- 2) Spray angle
- 3) Material (brass with stainless steel metering parts will be furnished if material is not specified). Order adapters separately, see selection chart.

\*NOT AVAILABLE IN 30°

WDA-WDB Nozzles above 16.0 GPH are furnished without strainers.

Max. Design Pressure: 500 psig

### DELAVAN TECHNICAL AIDS

For greater detail on nozzle selection and other technical subjects consult specific publications such as:

"Keep The Flame Burning" -- A video series (1/2" VHS) for service technicians. It is an overview of fuel oil heating, presented from the standpoint of nozzle needs. It points out and reminds the service technician of the various elements in a heating system that affect nozzle performance.

"A Total Look At Oil Burner Nozzles" -- A guide towards understanding how a nozzle works and what affects nozzle performance. Included are examples of proper nozzle selection, nozzle care and service tips plus a general trouble shooting guide and answers to some commonly asked questions by service technicians.

"How to Select the Right Nozzle" -- A four-page reprinted article which explains how to match a spray pattern to an air pattern for quiet, efficient performance.

"Combustion of Fuel Oil" -- A four-page reprinted article which explains what is meant by CO<sub>2</sub>, excess air and zero smoke in simple scientific terms.

"Oil Burner Nozzle Interchange Card" -- A wallet-size plastic card that will quickly tell you which Delavan nozzle will interchange with which competitive nozzles. Video tapes are also available. For more details contact: Delavan Fuel Metering Products Operation P.O. Box 969 • Bamberg • South Carolina 29003

### **Nozzle Dimensions**

### **Ordering Instructions**

WHEN ORDERING OIL BURNER NOZZLES, be sure to specify the following:

- (1) Quantity
- (2) Capacity rating in gallons per hour (gph)
- (3) Spray angle
- (4) Spray pattern or type:

Hollow cone--Type A, Del-O-Flo Type A

Solid cone--Type B, Del-O-Flo Type B, Type W

(5) Filter or strainer--See selection chart on page 8 for sintered filters and mesh strainers furnished with each nozzle. Optional mesh sizes may be substituted when ordering nozzles. Order by part number and description.

WHEN ORDERING ACCESSORIES, be sure to specify part number and brief description.

Delavan Fuel Metering Products Operation P.O. Box 969 • Bamberg • South Carolina 29003

Refer to each product section for specific instructions on information to include when ordering. Contact your Delavan representative or the factory for the current price list and for any assistance in finding the right nozzle for your application.

# DELAVAN OIL BURNER NOZZLES for industrial applications

### FOR INDUSTRIAL AND SPECIAL COMBUSTION APPLICATIONS

Delavan, as a world leader in nozzle technology, offers a unique variety of products to meet the requirements of domestic and industrial combustion.

### **VARIFLO - RETURN FLOW NOZZLES**

Pressure atomizing nozzles for good atomization over a wide flow range.

- Permits variable burner outputs based on by-pass pressure
- Wider spray angles at lower flow rates
- Less subject to clogging

### SNA-SIPHON TYPE AIR ATOMIZING NOZZLES

for extremely fine spray particle size at low air pressures

- Permits good combustion with medium and heavy oils
- Produces a solid cone spray with extremely fine particle size at low air pressures
- Clog free operation of low volume due to large inside passages and orifice

### **AIRO - AIR ATOMIZING NOZZLES**

For good atomization of both light and heavy oils at higher flow rates.

Covers a wide range of throughputs from 10.00 GPH (32 kg./h up to 200.00 GPH (720 kg./h)

### **SWIRL AIR - AIR ATOMIZING NOZZLES**

For maximum use of input hydraulic and pneumatic energy to atomize fuels at low pressures.

Delavan's two-fluid Swirl-Air nozzle is designed to make maximum use of input hydraulic and pneumatic energy to atomize fuels at low pressures. In combustion applications it can produce fine atomization at flow rates up to 300 gph.

### VARIFLOTM Pressure Atomizing Nozzles

## for good atomizing over a wide flow range

#### SPRAY CHARACTERISTICS

- Good atomization over a wider flow range.
- Wider spray angles at lower flow rates.
- Less subject to clogging.
- Less buildup of carbon and gum residue

### **HOW IT WORKS**

The Delavan Variflo nozzle is a pressure atomizing nozzle which provides discharge rate variations without changing nozzles. This is accomplished by the bypass principle.

With constant inlet supply pressure and the bypass (return line) closed, the nozzle operates as a simplex atomizing nozzle. For a reduced discharge flow the bypass line is opened and part of the fuel is allowed to return to the tank. The advantage is reduced flow without deterioration of the spray quality.

The maximum to minimum discharge flow rate at constant supply pressure is referred to as the "turndown ratio". The standard catalog nozzles have turndown ratios of approximately 5 to 1.

The key advantage of the Variflo over a simplex nozzle (like Delavan's oil burner nozzles) is flexibility; larger turndown ratios with better atomization. With the Variflo nozzle, using a constant supply pressure, the discharge flow rate varies approximately as the square of the bypass pressure. This means that at minimum flows the atomization pressure is reduced approximately 34 percent. With the simplex nozzle the discharge flow rate varies as the square root of the supply pressure. This means that to obtain one-half of the design flow rate the supply pressure must be reduced by 1/4 of the original pressure. This pressure is too low for good atomization.

### INSTALLATION

The Delavan Variflo nozzle may be:

1. Operated at a fixed discharge rate. The rates may be set by a valve to any flow rate in the nozzle's range.

- 2. Adapted for 2-stage firing. This is helpful when a low-fire start is required.
- 3. Operated with complete modulation over the deisgned flow range (with proper equipment).

The fuel supply system for the Variflo nozzle is the same inlet pump and pressure control system as for a simplex nozzle. The only difference is that pump capacity must be at least 50 percent over the rated (maximum) flow rate of the nozzle.

For a FIXED FIRING RATE, with manual adjustment when required, hook up as shown in figure 1. Use a relief valve for the bypass system control.

For 2-STAGE FIRING, the hookup is the same except a solenoid valve is added. (See inset, figure 1.) The bypass control valve in this hookup should be set for minimum flow with the solenoid normally open for low fire. High fire is obtained by closing the solenoid. The solenoid may be actuated by a timer or temperature or pressure sensing element.

For COMPLETE MODULATION, hook up as shown in figure 1 except use a modulating valve by temperature or pressure, through the proper modulating motor, linked to the combustion air supply.

Remove pressure gauges from the system after making adjustments. The pressure gauge provides an air cushion in the system which causes after-squirt and drooling.

Return the bypass line to the supply tank as shown in figure 1. The Variflo nozzle can, under some conditions, draw air into the bypass line through the discharge orifice even during operation. If the air were piped to the suction side of the pump, the pump could become air locked with a resulting pressure loss. Another advantage to returning the line to the tank is extended nozzle life because the nozzle will run cooler.

FIGURE 1. INSTALLATION SCHEMATIC

TYPICAL CURVE @ 100 & 300 PSI SUPPLY (5 to 1 turn down — 5/8" hex size)

NOTE: 30° & 90° nozzles listed above available on special order only.

Other flow rates and spray angles available on special order.

Nozzles are calibrated for flow and spray angle at 100 PSI on #2 oil. Spray angles at 300 PSI will be somewhat narrower than spray angle at 100 PSI. As bypass is opened, spray angle will increase (up to 15° wider) both at 100 PSI and 300 PSI supply.

### **ORDERING INSTRUCTIONS**

WHEN ORDERING VARIFLO NOZZLES, be sure to include both part number and description. Specify P/N 33769 – (see nozzle capacity chart for dash number corresponding to flow and spray angle desired). Order adapter separately (specify P/N 17147).

# SIPHON TYPE SNA<sup>TM</sup> Air Atomizing Nozzles

for extremely fine spray particle size at low air pressures

#### SPRAY CHARACTERISTICS

- Produces a solid cone spray pattern with extremely fine particle size at low air pressures and low CFM.
- Flow rates, spray angles and droplet sizes can be modified, with limitations, by variations in air, lift, etc.
- Clog free operation of low volume due to relatively large passages.

INSTALLATION

The air compressor should be capable of providing at least 10% more air than the specified values. All fuel and air line connections must be tight. Any leaks, especially in the fuel line, will have an adverse effect on the lift characteristics.

The nozzle will flow in either a horizontal or vertical position. The lift distance for a vertical mounted nozzle is measured from the liquid level to the end (face) of the nozzle. The lift distance for the horizontal mounting is shown in the installation drawing.

If the combustion application does not permit the use of a constant level device, excellent spray characteristics can be obtained using a fuel metering pump and an air compressor. It is also possible to operate the nozzle in a closed pressurized system utilizing air pressure for both lifting and atomizing the fuel.

### **ORDERING INSTRUCTIONS**

WHEN ORDERING SIPHON TYPE SNA NOZZLES, be sure to include both part number and description. Specify P/N 30609 – (see nozzle capacity chart for dash number corresponding to flow and spray angle desired). Order adapter separately (specify P/N 17147).

# AIRO<sup>TM</sup> Air Atomizing Nozzles

## for good atomization of both light and heavy fuels at higher flow rates

The industrial Airo Nozzle is an air atomizing nozzle designed to handle #2, #4, and preheated #5 and #6 fuels. Air is supplied at relatively low pressure to provide the energy for atomization. Air atomizing nozzles provide good atomization of fuels too viscuous for pressure atomizing nozzles. They can also provide finer breakup if sufficient air is available.

The Airo Nozzle is of the internal mixing type. That means that the air and fuel are piped separately to the nozzle and are mixed just before they enter the atomizing slots. The air under pressure is mixed thoroughly with the fuel in the swirl chamber so that a uniform emulsion is discharged through the orifice. The resultant spray is well atomized in a solid cone pattern.

The cost of equipment with air atomizing nozzles is higher than for equivalent pressure atomizing nozzles because of the addition of the compressor. The power requirement is also higher because of the extra power required to compress air. These disadvantages are offset, however, by the advantages in handling of heavy fuels.

#### **APPLICATIONS**

- The Airo Nozzle may be used as a fixed discharge nozzle. (Fuel metering is discussed in a following heading.)
- This nozzle may be arranged for two-stage firing if desired.
- This type of nozzle may be arranged for complete modulating over the desired flow range.
- The Airo Nozzle will handle light fuels at any flow rate from 2 GPH and up. The proper nozzle must be selected for each range.
- The Industrial Airo Nozzle will handle #5 oil or #6 oil preheated to approximately 100 SSU. Above 20 GPH, higher viscosities may be handled if sufficient air is available.

### SPRAY CHARACTERISTICS

- Uniform solid cone-spray angle varies with air pressure and flow. A separate metering device, such as an orifice, metering pump or valve is required.
- Large flow passages greatly reduce clogging.
- With the internal mixing type of nozzle, the spray angle changes with the fuel-air ratio (pounds of fuel per pound of atomizing air). The spray angle is wider at high fuel-air ratios. For example if the spray angle is 75° at a fuel-air ratio of 30 to 1, it may be reduced to 60° at a fuel-air ratio of 10 to 1.
- Higher air pressures produce narrower spray angles.
- Droplet size is smaller at higher air pressures and narrower spray angles.
- Constant spray angles may be obtained by modulating air pressure with the fluid flow.

#### **ADAPTERS**

Adapters are optional and, if required, must be ordered separately. Adapters come with seals installed.

| Hex Size | Part Number                   | Material                                 |
|----------|-------------------------------|--|
| 7/8      | 23034-1<br>23034-2            | Brass<br>Stainless steel                 |
| 1 1/4    | 30678-1<br>30678-2<br>30678-3 | Mild steel<br>Stainless steel<br>Inconel |

#### **INSTALLATION:**

#### **FUEL METERING**

- A fixed firing rate may be obtained by supplying fuel by a pressure pump through a fixed metering orifice to the nozzle.
- Two stage operation may be obtained by the use of two metering orifices in the fuel line, one of them in series with a solenoid valve. This solenoid valve will be actuated by pressure or temperature.
- A positive fuel metering pump of the piston type is satisfactory for single stage operation.
- Modulating metering may be obtained by the use of a fuel pump in combination with a modulating valve.
- Metering *cannot* be done with this type of nozzle by balancing fuel pressure against air pressure.

#### **METHODS OF METERING FUEL**

- Metering pump.
- Constant pressure pump and metering orifice in the line.
- Constant pressure pump and motorized modulating valve actuated by steam pressure, water or process temperature.

#### AIR COMPRESSOR

- May be rotary type for pressures up to 25 PSI or as rated by manufacturer.
- May be piston type for higher pressure.
- May have built in pressure relief valve.
- Must have enough capacity for the nozzle requirement.

#### **SPECIAL CONDITIONS:**

It may be necessary when burning residual fuels to provide some means for heating the nozzle and fuel line before starting. It may also be advantageous to provide air purge of the fuel line to the nozzle on shut-down.

It is *always* advisable to make certain that air flow through the nozzle is established *before* fuel is supplied. This will prevent backing up of fuel into the air line and equipment. It will also insure good atomization at the start.

#### **SERVICE:**

- Since the fuel and air passages in this type of nozzle are quite large, clogging is not a serious problem. It is recommended, however, that both the air and the fuel be filtered to remove lint and large particles of foreign matter. Clogging of air passages or fuel passages will result in off-center fires.
- Damage to the orifice may result in a streaky fire, an off-center fire, or drooling.

### **CONSTRUCTION & MATERIALS:**

The Airo nozzle is made up of three basic parts, available in the following materials:

- NOZZLE BODY Brass or stainless steel. Thread sizes: 3/4"-20 UNEF on #30615 and 1-1/8"-18 UNEF on #30616.
- DISTRIBUTOR Brass, stainless steel, or tungsten carbide (requires special body with replaceable tungsten carbide orifice disc, integral with body.)
- SCREW PIN Brass or stainless steel. NOTE: Contact factory for other material requirements.

### ORDERING INSTRUCTIONS

WHEN ORDERING AIRO NOZZLES, be sure to include both part number and description. To find part number and dash number, see the nozzle capacity charts. First locate the correct nozzle size and capacity, then select proper body material and screw pin type. NOTE: Please specify distributor material if different than screw pin material.

EXAMPLE: A 1-1/4" 100 GPH stainless steel nozzle with stainless steel, threaded screw pin is PN 30616-15.

It will be shipped with a stainless steel distributor.

Order adapter separately. Be sure to specify part number and description.

# SWIRL-AIR<sup>TM</sup> Combustion Air Atomizing Nozzles

for maximum use of input hydraulic and pneumatic energy to atomize fuels at low pressure

Delavan's two-fluid Swirl-Air is designed to make maximum use of input hydraulic and pneumatic energy to atomize fuels at low pressures. In combustion applications it can produce fine atomization at flow rates up to 300 gph.

Fuel enters the mixing chamber axially coming in contact with tangentially introduced streams of air (or steam). Interaction of the two creates extreme turbulence and mixing. Finally the fuel-air mixture impinges against a circular deflector ring, or pintle plate, before leaving the nozzle as a finely atomized spray.

Design of the pintle plate support eliminates the need for external struts that could interfere with the spray pattern. The progressive application of shear and inertial forces within the nozzle helps to provide high nozzle efficiencies.

### SWIRL-AIR ADVANTAGES

Large fuel passages and lack of torturous paths reduce chances for clogging.

Air consumption (SCFM) and power requirements are relatively low, permitting the use of smaller, more economical, air compressors and blowers.

Good atomization ratios.

Nozzle configuration provides vortex mixing of two fluids.

Can handle fuels up to Type C Bunker oil...also combustible waste liquids. (The use of Swirl-Air nozzles in burning Bunker oils often reduces the accumulation of ashes caused by the high concentrations of impurities such as vanadium and sulphur).

Various spray angles and capacities are available through a selection of metering sets and swirl chambers.

No external struts that interfere with the spray.

### **APPLICATIONS**

The list of industrial combustion applications for the Swirl-Air nozzle continues to grow. Here are some of the more common ones:

- As igniter nozzles in both coal-fired and oil-fired electric power stations.
- As main atomizers in large burners, especially where heavier fuels are used. Advantages include one or more of the following: Fewer flue deposits (ashes), lower smoke reading (0 Bacharach not uncommon), higher CO<sub>2</sub> and lower pre-heat temperatures.
- As an incineration atomizer: Products such as waste water, mustard gas, chemical wastes, eggs etc. have been handled successfully.

### **SPRAY CHARACTERISTICS:**

Air, steam, or even a process gas, is introduced tangentially into the nozzle chamber in the low pressure region of the swirling mixture, creating extreme turbulence and primary atomization. As the fuel leaves the orifice, it impinges against the deflector ring which serves a dual purpose: close control of spray angle and breakup of the spray into even finer droplets (secondary atomization). Upon leaving the nozzle, the mixture swirls in a clockwise direction, looking downstream.

The nozzle has demonstrated the capability of achieving mean droplet diameters in the 50 to 100 micron range at modest air pressures and air volumes (SCFM). When using steam instead of air, the steam pressure should be approximately four times greater to achieve the same spray characteristics. Comparable atomization in a hydraulic nozzle would usually require very high fuel pressures. The degree of atomization is also fuel pressures. The degree of atomization is also variable by controlling the ratio of air to fuel flows.

#### **CONSTRUCTION & MATERIALS:**

Four-Piece construction (see below): (1) nozzle body (adapter), (2) swirl chamber, (3) metering set (integral nut and pintle) and (4) nozzle cap.

Parallel and concentric bodies (adapters) are available. Both are shown in the dimensional drawings.

Standard nozzle material is mild steel for all four basic parts. Other materials available on special request.

### CONSIDERATIONS BEFORE ORDERING:

With the wide variety of combustion applications, there is no way to cover all possibilities in one piece of literature. There are, for example, the problems of nozzle fixtures, the adaptations necessary for existing fireheads, and the needs for special adapters. So if yours is such an application, send us the details and we will give you our recommendation. Use the following list of questions as your guideline:

- (1) What type of fuel? (#2, #4, #6 oil etc.)
- (2) Required flow rate in gallons per hour?
- (3) What atomizing fluid...air, steam or other?
- (4) What atomizing fluid pressure...(psig) is available?
- (5) What atomizing fluid volume (scfm) is available?
- (6) What fuel pressure (psig) is available?
- (7) What is the method of attaching both fuel and atomizing fluid lines to the nozzle? Parallel pipes? Pipe within a pipe? Or Other?
- (8) Fuel pipe size?
- (9) Atomizing fluid pipe size?
- (10) Approximate spray angle required?
- (11) If possible, also furnish prints of existing installation, or a free-hand sketch.

- \* When ordering either a complete nozzle assembly or just a metering set, be sure to specify one of the dash numbers below to designate spray angle.
- \*\* Body subassembly 34516 includes swirl chamber for concentric model.
- # Swirl Chamber 34427 is for parallel model only.

#### SWIRL-AIR NOZZLE CAPACITIES

(Based on #2 fuel oil)

The capacities shown in the following charts will (1) serve as a guide to nozzle selection and (2) rate each nozzle according to minimum atomization energy expended per gallon of #2 oil burned. For example, both the 150 gph and 200 gph nozzles are flow rated at 150 gph, but the 200 gph nozzle has a higher air/fuel ratio. The wide turn-down capability of this nozzle also permits each nozzle to be operated at capacities less than shown. However, very low flows would require installation of a fuel metering pre-orifice or valve to prevent oscillation or "chugging" in the fuel line or system. Ideally, a nozzle should be selected for minimum energy used for atomization and for optimum burner performance. For some applications this may require customer testing.

**50 GPH** #34429 and #34460

Air Inlet
(1/2 NPTF)

Set

Combustion Swirl-Air Nozzle
(Concentric — 50 GPH)

#### **ORDERING INSTRUCTIONS**

Refer to "Considerations Before Ordering" section (page 25) if your specific requirements are not met by the information shown in this catalog.

WHEN ORDERING SWIRL-AIR NOZZLES, be sure to include both part number and description. Specify the complete assembly number, including the dash number

that corresponds to the spray angle you need. To order individual parts, use the part numbers shown, but make sure you add the proper dash number on metering sets to designate spray angle.

EXAMPLE: P/N 33240-3 is a 60 gph 90° parallel inlet nozzle.

### **ISO 9001 CERTIFIED**

### **DELAVAN PRODUCTS WARRANTY**

All products sold by Delavan are warranted only to purchasers from Delavan for resale or for use in purchasers' own business or original equipment manufacture, against defects in workmanship or materials under normal use, maintenance and service (rental use excluded), if notice of said defect is received by Delavan at the factory within 90 days after installation or one year from date of shipment from the factory, whichever first occurs. The sole and exclusive obligation of Delavan under this or any implied warranty shall be to replace or, at its option, to repair, without charge, any product which is determined by Delavan to be defective in workmanship or materials after the product is returned to the Delavan factory, shipping costs prepaid. In no event shall Delavan be liable to any person for indirect or consequential damages or for injury or commercial loss resulting from any use or inability to use any Delavan product. DELAVAN EXPRESSIVELY NEGATES ANY OTHER WARRANTY, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTY OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR ARISING FROM ANY COURSE OF DEALING OR CUSTOM OR USAGE OR TRADE. No person, including any dealer or representative of Delavan, is authorized to make any representation or warranty on behalf of Delavan in addition to or inconsistent with these provisions. Purchasers to whom these provisions apply agree to hold Delavan harmless from claims by their customers in excess of the obligations of Delavan expressly set forth herein.
